

FABADS - PRODUCT RESEARCH

Launch 2.0

"Launch Strategies"

Research findings - what it is, why, and what we found.
Meta-only. Pre-decision (decisions come in the Q and A).

Prepared 2026-06-04. Sources: codebase audit, market and user research, competitor teardown, Meta field inventory, the Lovable prototype. Every claim is evidence-backed.

TL;DR

WHAT. Launch 2.0 = ready-made "recipes" to launch many Meta ads in one go - pick a recipe, add creatives, the system builds and spreads the ads, one preview, launch.

WHY. Today's launch is slow, manual, and **fake** - it shows "success" without really publishing. And it is missing half of Meta's fields (custom audience, etc.).

THE OPENING. No competitor packages launch as guided strategies, and none own multi-account distribution / warm-up / account-health. That band is ours - but only after launch actually works and matches table-stakes (e.g. AdManage).

THIS DECK. Research only. No decisions yet - those come in the Q and A next.

What is Launch 2.0?

A faster, guided way to launch lots of Meta ads at once. Instead of filling every field by hand, the user picks a **ready-made strategy**.

The flow: 1. Pick a Strategy (e.g. 1:5:1) to 2. Add Creatives to 3. System builds and distributes across accounts/pages to 4. One Preview to **5. Launch**

Goal: fewer inputs, stronger validation, fewer mistakes. Advanced users can still build "from scratch" - but the aim is they rarely need to.

Why now - 3 real problems

1 - BROKEN. Today's launch doesn't actually publish - the execution is a stub that fakes "Launch successful!". Catalogue and Fast-Launch don't execute at all.

2 - CONFUSING. Long, multi-step, back-and-forth flow. Validation is scattered and skippable, so users hit errors AFTER launching, the experience sours, and they may not retry. (Neeraj's point.)

3 - INCOMPLETE. Half of Meta's fields are missing - custom audiences, lookalikes, "use existing post", real pixel/conversion, and more. Objectives are even stale.

Scope

IN - Launch 2.0 is ONLY this	OUT - handled elsewhere
Launching Meta ads: structure (recipe) + creatives + all Meta fields + distribution across accounts/pages + actually executing it reliably + activity logs.	Scaling winners, optimization, rejection recovery - the job of Reports + the Rule Engine, not Launch. The user scales manually or via a rule.

META-ONLY for now: Facebook + Instagram. (AdManage-style multi-platform is out of scope.)

This keeps Launch 2.0 focused: launch is only about launching.

Users

Persona	Fit	What they need
Dropship / agency-account operator	Sharpest	Many ad accounts + pages; lives with bans; high volume.
Agency lead	High	Many clients/accounts; speed + delegation.
Solo performance operator	Medium	Runs real spend solo; speed without a team.
Performance marketer (in-house)	Medium	Optimization-minded; structured testing.
Brand manager	Lower	Fewer launches; brand-safety.

Priority for v1 is a Q and A decision - the first two carry the volume and pain that "Launch Strategies" targets.

The biggest pains

#	Pain	Evidence
1	Ad-account bans / restrictions, no support	Most-repeated complaint; people pay 3-15% of spend (or a flat 200-1500+/mo) for rented accounts just to dodge it.
2	Bulk-launch tedium (building/duplicating many ads by hand)	The whole reason this tool category exists.
3	Managing many accounts + pages (the 250/page wall)	Meta caps 250 active ads per Page, shared across accounts - forces multi-account sprawl.
4	Keeping social proof when duplicating	Post-ID reuse is a known scaling need.

Note: deep forum/Reddit sources were blocked in this environment; pains corroborated via reviews + market reports. A few vendor stats are flagged directional in the detail docs.

What a "Launch Strategy" is

A strategy = a structure written as **campaign : ad set : ad**.

Recipe	Means	Isolates...
1 : 5 : 1	1 campaign, 5 ad sets, 1 ad each	Audience test (same ad, 5 audiences)
1 : 1 : 5	1 campaign, 1 ad set, 5 ads	Creative test (1 audience, 5 ads)
1 : 3 : 5	1 campaign, 3 ad sets, 5 ads	Both
"Bruno"	1000s of cheap ads, tiny budgets	Mass-test to find winners (name unconfirmed)

Important: all named recipes are TEST shapes - there is no named scaling recipe (and scaling is out of Launch's scope anyway). "Bruno" only works across many Pages because of the 250-cap.

Creative mapping - 3 modes

Mode	What it does	Best for
Distribute across ads	Spread each media item across the ad slots, repeating as needed.	Fast experiments
Multiply by media	Clone the whole structure once per creative (5 media gives 5x the structure).	Clean per-creative read
Map manually	Drag exact creatives into exact slots.	Hand-crafted launches

Finding: in the prototype these 3 are not really distinct - "Manual" is just "Distribute" + overrides, and "Multiply" has a math bug. **Neeraj asked "are these the same?" - basically yes, today.** 2.0 must make them genuinely distinct (or collapse to 2 + an override) and **show creative thumbnails** (currently filename dropdowns only).

v1 is missing most Meta fields

Field	In v1 today?
Custom audiences	FAKE STUB - a name box + platform dropdown only
Lookalikes / saved audiences	ABSENT
"Use existing post" / Post ID	ABSENT - a core Meta path
Real pixel / conversion / attribution	ABSENT
Interests / behaviors / demographics	ABSENT
Dayparting, A/B test, frequency cap, cost-cap/ROAS	ABSENT
Campaign objectives	STALE - old labels; Meta changed them
Basic campaign/ad-set/creative fields	~30-40% present (but mock, fake backend)

Net: 2.0 builds the Meta field layer from scratch; v1 is a partial reference. (Exactly Neeraj's "custom audience chhoot gaya tha" point - confirmed and bigger.)

Prototype = reference only

A polished demo of about 40% of one happy path. Not reusable as-is.

Gaps	Worth carrying (the idea)
Scale is fake (caps at 12 rows; no virtualization). Validation scattered and ungated (publish not blocked). 3 mapping modes not distinct; no thumbnails. No account-health, retry, or activity logs. No empty / zero-data states.	Before/after "Resulting shape" preview. Per-row publish/status center. AI-enhance toggle with conflict warning. Persistent entity/issue counter. Entry-from-context deep-link. Multi-view matrix / sheet / JSON editor.

The market and AdManage

OUR EMPTY BAND: Nobody ships named launch-structure "recipes", and nobody owns (account x page) distribution, the 250-cap, warm-up, or account-health. That is FabAds' wedge.
AdManage (the one to match feature-wise) is a fast launcher, strong where v1 is weak:

AdManage does (we don't)	AdManage does NOT (our wedge)
Actually launches (100+ ads in under a minute). Auto-group by aspect ratio to placements. Media "Smart Fix" + thumbnails. Post-ID reuse + pixel re-map on duplicate. Rich formats: carousel, collection, flexible, partnership, multi-language. Cloud / Sheets / API / MCP import.	Multi-page (account x page) distribution. 250-ads/page cap awareness. Warm-up ramp. Recurring auto-launch. Account-health / rejection recovery.

Note: the 2 AdManage YouTube videos could not be opened here (allowlist blocked). Findings are from their site/docs/API; the targeting-UI depth in those videos is still unverified.

Fields and constraints

All Meta fields - incl. the ones v1 missed: custom audiences, lookalikes, saved audiences, **post-ID / existing post**, real pixel + conversion + attribution, interests/behaviors targeting, formats (carousel/collection/flexible), dayparting. (Team callouts: post-ID, custom audience, static/flexible, catalogue-partnership.)

The 250-ads-per-Page cap - Meta caps active ads per Page, aggregated across all ad accounts. This is exactly why distribution across (account, page) pairs matters - our differentiator and a hard rule the builder must respect.

Scale - bulk means thousands of rows. Needs table virtualization + server-side batched execution + real page-capacity data (today it is mock).

Open questions

1. **Entry point** - creatives-first or strategy-first? (Both wanted; which is primary?)
2. **Per-strategy details** - budget (CBO/ABO + amounts), targeting, mapping default for 1:5:1 / 1:3:5 / 1:1:5.
3. **"Bruno"** - confirm the name + exact structure + budget floor.
4. **Which recipe ships first?**
5. **Editing on the final preview screen** - how much is allowed?
6. **Can users save their own strategies?**
7. **Catalogue mapping** - at account / campaign / ad-set / ad level?
8. **Pricing** for Enterprise flows.
9. **Publish permissions** - role-gated? (today any member can publish)

Next steps

DONE: Research (this deck) to **NOW: Q and A** (answer the open questions) to **THEN: Design + build** (no build until Q and A closes).

One side task: someone with normal YouTube access watches the 2 AdManage demo videos - they would fill the one gap we could not (their targeting / audience-picker depth).

Full evidence + citations live in docs/launch-2.0/ (00-08). This deck is the readable summary; nothing here is assumed without a source.
